## Probability

### Probability models and axioms

Definition (Sample space) A sample space $\Omega$ is the set of all possible outcomes. The set's elements must be mutually exclusive, collectively exhaustive and at the right granularity.

Definition (Event) An event is a subset of the sample space. Probability is assigned to events.

Definition (Probability axioms) A probability law $\mathbb{P}$ assigns probabilities to events and satisfies the following axioms:

**Nonnegativity** $\mathbb{P}(A) \geq 0$ for all events $A$.

**Normalization** $\mathbb{P}(\Omega) = 1$.

**(Countable) additivity** For every sequence of events $A_1, A_2, \ldots$ such that $A_i \cap A_j = \varnothing$: $\mathbb{P}\left(\bigcup_i A_i\right) = \sum_i \mathbb{P}(A_i)$.

Corollaries (Consequences of the axioms)

- $\mathbb{P}(\varnothing) = 0$.
- For any finite collection of disjoint events $A_1, \ldots, A_n$, $\mathbb{P}\left(\bigcup_{i=1}^n A_i\right) = \sum_{i=1}^n \mathbb{P}(A_i)$.
- $\mathbb{P}(A) + \mathbb{P}(A^c) = 1$.
- $\mathbb{P}(A) \leq 1$.
- If $A \subset B$, then $\mathbb{P}(A) \leq \mathbb{P}(B)$.
- $\mathbb{P}(A \cup B) = \mathbb{P}(A) + \mathbb{P}(B) - \mathbb{P}(A \cap B)$.
- $\mathbb{P}(A \cup B) \leq \mathbb{P}(A) + \mathbb{P}(B)$.

Example (Discrete uniform law) Assume $\Omega$ is finite and consists of $n$ equally likely elements. Also, assume that $A \subset \Omega$ with $k$ elements. Then $\mathbb{P}(A) = \frac{k}{n}$.

### Conditioning and Bayes' rule

Definition (Conditional probability) Given that event $B$ has occurred and that $P(B) > 0$, the probability that $A$ occurs is

$$\mathbb{P}(A|B) \triangleq \frac{\mathbb{P}(A \cap B)}{\mathbb{P}(B)}.$$

Remark (Conditional probabilities properties) They are the same as ordinary probabilities. Assuming $\mathbb{P}(B) > 0$:

- $\mathbb{P}(A|B) \geq 0$.
- $\mathbb{P}(\Omega|B) = 1$
- $\mathbb{P}(B|B) = 1$.
- If $A \cap C = \varnothing$, $\mathbb{P}(A \cup C|B) = \mathbb{P}(A|B) + \mathbb{P}(C|B)$.

Proposition (Multiplication rule)

$$\mathbb{P}(A_1 \cap A_2 \cap \cdots \cap A_n) = \mathbb{P}(A_1) \cdot \mathbb{P}(A_2|A_1) \cdots \mathbb{P}(A_n|A_1 \cap A_2 \cap \cdots \cap A_{n-1}).$$

Theorem (Total probability theorem) Given a partition $\{A_1, A_2, \ldots\}$ of the sample space, meaning that $\bigcup_i A_i = \Omega$ and the events are disjoint, and for every event $B$, we have

$$\mathbb{P}(B) = \sum_i \mathbb{P}(A_i)\mathbb{P}(B|A_i).$$

Theorem (Bayes' rule) Given a partition $\{A_1, A_2, \ldots\}$ of the sample space, meaning that $\bigcup_i A_i = \Omega$ and the events are disjoint, and if $\mathbb{P}(A_i) > 0$ for all $i$, then for every event $B$, the conditional probabilities $\mathbb{P}(A_i|B)$ can be obtained from the conditional probabilities $\mathbb{P}(B|A_i)$ and the initial probabilities $\mathbb{P}(A_i)$ as follows:

$$\mathbb{P}(A_i|B) = \frac{\mathbb{P}(A_i)\mathbb{P}(B|A_i)}{\sum_j \mathbb{P}(A_j)\mathbb{P}(B|A_j)}.$$

### Independence

Definition (Independence of events) Two events are independent if occurrence of one provides no information about the other. We say that $A$ and $B$ are independent if

$$\mathbb{P}(A \cap B) = \mathbb{P}(A)\mathbb{P}(B).$$

Equivalently, as long as $\mathbb{P}(A) > 0$ and $\mathbb{P}(B) > 0$,

$$\mathbb{P}(B|A) = \mathbb{P}(B) \qquad \mathbb{P}(A|B) = \mathbb{P}(A).$$

Remarks

- The definition of independence is symmetric with respect to $A$ and $B$.
- The product definition applies even if $\mathbb{P}(A) = 0$ or $\mathbb{P}(B) = 0$.

Corollary If $A$ and $B$ are independent, then $A$ and $B^c$ are independent. Similarly for $A^c$ and $B$, or for $A^c$ and $B^c$.

Definition (Conditional independence) We say that $A$ and $B$ are independent conditioned on $C$, where $\mathbb{P}(C) > 0$, if

$$\mathbb{P}(A \cap B|C) = \mathbb{P}(A|C)\mathbb{P}(B|C).$$

Definition (Independence of a collection of events) We say that events $A_1, A_2, \ldots, A_n$ are independent if for every collection of distinct indices $i_1, i_2, \ldots, i_k$, we have

$$\mathbb{P}(A_{i_1} \cap \ldots \cap A_{i_k}) = \mathbb{P}(A_{i_1}) \cdot \mathbb{P}(A_{i_2}) \cdots \mathbb{P}(A_{i_k}).$$

### Counting

This section deals with finite sets with uniform probability law. In this case, to calculate $\mathbb{P}(A)$, we need to count the number of elements in $A$ and in $\Omega$.

Remark (Basic counting principle) For a selection that can be done in $r$ stages, with $n_i$ choices at each stage $i$, the number of possible selections is $n_1 \cdot n_2 \cdots n_r$.

Definition (Permutations) The number of permutations (orderings) of $n$ different elements is

$$n! = 1 \cdot 2 \cdot 3 \cdots n.$$

Definition (Combinations) Given a set of $n$ elements, the number of subsets with exactly $k$ elements is

$$\binom{n}{k} = \frac{n!}{k!(n-k)!}.$$

Definition (Partitions) We are given an $n$–element set and nonnegative integers $n_1, n_2, \ldots, n_r$, whose sum is equal to $n$. The number of partitions of the set into $r$ disjoint subsets, with the $i^{\text{th}}$ subset containing exactly $n_i$ elements, is equal to

$$\binom{n}{n_1, \ldots, n_r} = \frac{n!}{n_1! n_2! \cdots n_r!}.$$

Remark This is the same as counting how to assign $n$ distinct elements to $r$ people, giving each person $i$ exactly $n_i$ elements.

### Discrete random variables

*Probability mass function and expectation*

Definition (Random variable) A random variable $X$ is a function of the sample space $\Omega$ into the real numbers (or $\mathbb{R}^n$). Its range can be discrete or continuous.

Definition (Probability mass funtion (PMF)) The probability law of a discrete random variable $X$ is called its PMF. It is defined as

$$p_X(x) = \mathbb{P}(X = x) = \mathbb{P}\left(\{\omega \in \Omega : X(\omega) = x\}\right).$$

Properties

$p_X(x) \geq 0$, $\forall\, x$.

$\sum_x p_X(x) = 1$.

Example (Bernoulli random variable) A Bernoulli random variable $X$ with parameter $0 \leq p \leq 1$ ($X \sim \text{Ber}(p)$) takes the following values:

$$X = \begin{cases} 1 & \text{w.p. } p, \\ 0 & \text{w.p. } 1-p. \end{cases}$$

An indicator random variable of an event ($I_A = 1$ if $A$ occurs) is an example of a Bernoulli random variable.

Example (Discrete uniform random variable) A Discrete uniform random variable $X$ between $a$ and $b$ with $a \leq b$ ($X \sim \text{Uni}[a, b]$) takes any of the values in $\{a, a+1, \ldots, b\}$ with probability $\frac{1}{b-a+1}$.

Example (Binomial random variable) A Binomial random variable $X$ with parameters $n$ (natural number) and $0 \leq p \leq 1$ ($X \sim \text{Bin}(n, p)$) takes values in the set $\{0, 1, \ldots, n\}$ with probabilities $p_X(i) = \binom{n}{i} p^i (1-p)^{n-i}$.
It represents the number of successes in $n$ independent trials where each trial has a probability of success $p$. Therefore, it can also be seen as the sum of $n$ independent Bernoulli random variables, each with parameter $p$.

Example (Geometric random variable) A Geometric random variable $X$ with parameter $0 \leq p \leq 1$ ($X \sim \text{Geo}(p)$) takes values in the set $\{1, 2, \ldots\}$ with probabilities $p_X(i) = (1-p)^{i-1} p$.
It represents the number of independent trials until (and including) the first success, when the probability of success in each trial is $p$.

Definition (Expectation/mean of a random variable) The expectation of a discrete random variable is defined as

$$\mathbb{E}[X] \triangleq \sum_x x p_X(x).$$

assuming $\sum_x |x| p_X(x) < \infty$.

Properties (Properties of expectation)

- If $X \geq 0$ then $\mathbb{E}[X] \geq 0$.
- If $a \leq X \leq b$ then $a \leq \mathbb{E}[X] \leq b$.
- If $X = c$ then $\mathbb{E}[X] = c$.

Example Expected value of know r.v.

- If $X \sim \text{Ber}(p)$ then $\mathbb{E}[X] = p$.
- If $X = I_A$ then $\mathbb{E}[X] = \mathbb{P}(A)$.
- If $X \sim \text{Uni}[a, b]$ then $\mathbb{E}[X] = \frac{a+b}{2}$.
- If $X \sim \text{Bin}(n, p)$ then $\mathbb{E}[X] = np$.
- If $X \sim \text{Geo}(p)$ then $\mathbb{E}[X] = \frac{1}{p}$.

Theorem (Expected value rule) Given a random variable $X$ and a function $g:\mathbb{R}\to\mathbb{R}$, we construct the random variable $Y=g(X)$. Then

$$\sum_y yp_Y(y)=\mathbb{E}[Y]=\mathbb{E}[g(X)]=\sum_x g(x)p_X(x).$$

Remark (PMF of $Y=g(X)$) The PMF of $Y=g(X)$ is $p_Y(y)=\sum_{x:g(x)=y}p_X(x)$.

Remark In general $g(\mathbb{E}[X])\neq\mathbb{E}[g(X)]$. They are equal if $g(x)=ax+b$.

*Variance, conditioning on an event, multiple r.v.*

Definition (Variance of a random variable) Given a random variable $X$ with $\mu=\mathbb{E}[X]$, its variance is a measure of the spread of the random variable and is defined as

$$\mathrm{Var}(X)\triangleq\mathbb{E}\left[(X-\mu)^2\right]=\sum_x(x-\mu)^2p_X(x).$$

Definition (Standard deviation)

$$\sigma_X=\sqrt{\mathrm{Var}(X)}.$$

Properties (Properties of the variance)

- $\mathrm{Var}(aX)=a^2\,\mathrm{Var}(X)$, for all $a\in\mathbb{R}$.
- $\mathrm{Var}(X+b)=\mathrm{Var}(X)$, for all $b\in\mathbb{R}$.
- $\mathrm{Var}(aX+b)=a^2\,\mathrm{Var}(X)$.
- $\mathrm{Var}(X)=\mathbb{E}[X^2]-(\mathbb{E}[X])^2$.

Example (Variance of known r.v.)

- If $X\sim\mathrm{Ber}(p)$, then $\mathrm{Var}(X)=p(1-p)$.
- If $X\sim\mathrm{Uni}[a,b]$, then $\mathrm{Var}(X)=\frac{(b-a)(b-a+2)}{12}$.
- If $X\sim\mathrm{Bin}(n,p)$, then $\mathrm{Var}(X)=np(1-p)$.
- If $X\sim\mathrm{Geo}(p)$, then $\mathrm{Var}(X)=\frac{1-p}{p^2}$

Proposition (Conditional PMF and expectation, given an event) Given the event $A$, with $\mathbb{P}(A)>0$, we have the following

- $p_{X|A}(x)=\mathbb{P}(X=x|A)$.
- If $A$ is a subset of the range of $X$, then:
  $p_{X|A}(x)\triangleq p_{X|\{X\in A\}}(x)=\begin{cases}\frac{1}{\mathbb{P}(A)}p_X(x), & \text{if } x\in A,\\ 0, & \text{otherwise.}\end{cases}$
- $\sum_x p_{X|A}(x)=1$.
- $\mathbb{E}[X|A]=\sum_x xp_{X|A}(x)$.
- $\mathbb{E}[g(X)|A]=\sum_x g(x)p_{X|A}(x)$.

Proposition (Total expectation rule) Given a partition of disjoint events $A_1,\dots,A_n$ such that $\sum_i\mathbb{P}(A_i)=1$, and $\mathbb{P}(A_i)>0$,

$$\mathbb{E}[X]=\mathbb{P}(A_1)\mathbb{E}[X|A_1]+\cdots+\mathbb{P}(A_n)\mathbb{E}[X|A_n].$$

Definition (Memorylessness of the geometric random variable) When we condition a geometric random variable $X$ on the event $X>n$ we have memorylessness, meaning that the "remaining time" $X-n$, given that $X>n$, is also geometric with the same parameter. Formally,

$$p_{X-n|X>n}(i)=p_X(i).$$

Definition (Joint PMF) The joint PMF of random variables $X_1,X_2,\dots,X_n$ is $p_{X_1,X_2,\dots,X_n}(x_1,\dots,x_n)=\mathbb{P}(X_1=x_1,\dots,X_n=x_n)$.

Properties (Properties of joint PMF)

- $\sum_{x_1}\cdots\sum_{x_n}p_{X_1,\dots,X_n}(x_1,\dots,x_n)=1$.
- $p_{X_1}(x_1)=\sum_{x_2}\cdots\sum_{x_n}p_{X_1,\dots,X_n}(x_1,x_2,\dots,x_n)$.
- $p_{X_2,\dots,X_n}(x_2,\dots,x_n)=\sum_{x_1}p_{X_1,X_2,\dots,X_n}(x_1,x_2,\dots,x_n)$.

Definition (Functions of multiple r.v.) If $Z=g(X_1,\dots,X_n)$, where $g:\mathbb{R}^n\to\mathbb{R}$, then $p_Z(z)=\mathbb{P}(g(X_1,\dots,X_n)=z)$.

Proposition (Expected value rule for multiple r.v.) Given $g:\mathbb{R}^n\to\mathbb{R}$,

$$\mathbb{E}[g(X_1,\dots,X_n)]=\sum_{x_1,\dots,x_n}g(x_1,\dots,x_n)p_{X_1,\dots,X_n}(x_1,\dots,x_n).$$

Properties (Linearity of expectations)

- $\mathbb{E}[aX+b]=a\mathbb{E}[X]+b$.
- $\mathbb{E}[X_1+\cdots+X_n]=\mathbb{E}[X_1]+\cdots+\mathbb{E}[X_n]$.

*Conditioning on a random variable, independence*

Definition (Conditional PMF given another random variable) Given discrete random variables $X,Y$ and $y$ such that $p_Y(y)>0$ we define

$$p_{X|Y}(x|y)\triangleq\frac{p_{X,Y}(x,y)}{p_Y(y)}.$$

Proposition (Multiplication rule) Given jointly discrete random variables $X,Y$, and whenever the conditional probabilities are defined,

$$p_{X,Y}(x,y)=p_X(x)p_{Y|X}(y|x)=p_Y(y)p_{X|Y}(x|y).$$

Definition (Conditional expectation) Given discrete random variables $X,Y$ and $y$ such that $p_Y(y)>0$ we define

$$\mathbb{E}[X|Y=y]=\sum_x xp_{X|Y}(x|y).$$

Additionally we have

$$\mathbb{E}[g(X)|Y=y]=\sum_x g(x)p_{X|Y}(x|y).$$

Theorem (Total probability and expectation theorems) If $p_Y(y)>0$, then

$$p_X(x)=\sum_y p_Y(y)p_{X|Y}(x|y),$$
$$\mathbb{E}[X]=\sum_y p_Y(y)\mathbb{E}[X|Y=y].$$

Definition (Independence of a random variable and an event) A discrete random variable $X$ and an event $A$ are independent if $\mathbb{P}(X=x\text{ and }A)=p_X(x)\mathbb{P}(A)$, for all $x$.

Definition (Independence of two random variables) Two discrete random variables $X$ and $Y$ are independent if $p_{X,Y}(x,y)=p_X(x)p_Y(y)$ for all $x,y$.

Remark (Independence of a collection of random variables) A collection $X_1,X_2,\dots,X_n$ of random variables are independent if

$$p_{X_1,\dots,X_n}(x_1,\dots,x_n)=p_{X_1}(x_1)\cdots p_{X_n}(x_n),\ \forall\,x_1,\dots,x_n.$$

Remark (Independence and expectation) In general, $\mathbb{E}[g(X,Y)]\neq g(\mathbb{E}[X],\mathbb{E}[Y])$. An exception is for linear functions: $\mathbb{E}[aX+bY]=a\mathbb{E}[X]+b\mathbb{E}[Y]$.

Proposition (Expectation of product of independent r.v.) If $X$ and $Y$ are discrete independent random variables,

$$\mathbb{E}[XY]=\mathbb{E}[X]\mathbb{E}[Y].$$

Remark If $X$ and $Y$ are independent, $\mathbb{E}[g(X)h(Y)]=\mathbb{E}[g(X)]\,\mathbb{E}[h(Y)]$.

Proposition (Variance of sum of independent random variables) IF $X$ and $Y$ are discrete independent random variables,

$$\mathrm{Var}(X+Y)=\mathrm{Var}(X)+\mathrm{Var}(Y).$$

## Continuous random variables

*PDF, Expectation, Variance, CDF*

Definition (Probability density function (PDF)) A probability density function of a r.v. $X$ is a non-negative real valued function $f_X$ that satisfies the following

- $\int_{-\infty}^{\infty}f_X(x)\mathrm{d}x=1$.
- $\mathbb{P}(a\le X\le b)=\int_a^b f_X(x)\mathrm{d}x$ for some random variable $X$.

Definition (Continuous random variable) A random variable $X$ is continuous if its probability law can be described by a PDF $f_X$.

Remark Continuous random variables satisfy:

- For small $\delta>0$, $\mathbb{P}(a\le X\le a+\delta)\approx f_X(a)\delta$.
- $\mathbb{P}(X=a)=0$, $\forall a\in\mathbb{R}$.

Definition (Expectation of a continuous random variable) The expectation of a continuous random variable is

$$\mathbb{E}[X]\triangleq\int_{-\infty}^{\infty}xf_X(x)\mathrm{d}x.$$

assuming $\int_{-\infty}^{\infty}|x|f_X(x)\mathrm{d}x<\infty$.

Properties (Properties of expectation)

- If $X\ge0$ then $\mathbb{E}[X]\ge0$.
- If $a\le X\le b$ then $a\le\mathbb{E}[X]\le b$.
- $\mathbb{E}[g(X)]=\int_{-\infty}^{\infty}g(x)f_X(x)\mathrm{d}x$.
- $\mathbb{E}[aX+b]=a\mathbb{E}[X]+b$.

Definition (Variance of a continuous random variable) Given a continuous random variable $X$ with $\mu=\mathbb{E}[X]$, its variance is

$$\mathrm{Var}(X)=\mathbb{E}\left[(X-\mu)^2\right]=\int_{-\infty}^{\infty}(x-\mu)^2f_X(x)\mathrm{d}x.$$

It has the same properties as the variance of a discrete random variable.

Example (Uniform continuous random variable) A Uniform continuous random variable $X$ between $a$ and $b$, with $a<b$, $(X\sim\mathrm{Uni}(a,b))$ has PDF

$$f_X(x)=\begin{cases}\frac{1}{b-a}, & \text{if } a<x<b,\\ 0, & \text{otherwise.}\end{cases}$$

We have $\mathbb{E}[X]=\frac{a+b}{2}$ and $\mathrm{Var}(X)=\frac{(b-a)^2}{12}$.
